Transport Management System

...Managing Your
Transport Operation
from Anywhere...

Who fails to plan,
plans to fail

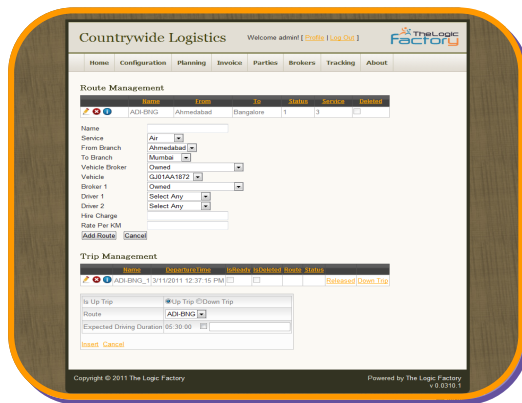

INTRODUCTION

The Logic Factory (TLF) Transport Management System (TMS) is supporting the complete transport process. There is a huge information flow around the physical transport process which is needed. This information flow is essential and has to be properly in place in order to run a successful transport business. The TLF TMS is supporting the processes ranging from customer order till detailed invoice, including multiple depot support.

MAIN FUNCTIONS

The TLF TMS is not only supporting the administrative parts for a transport company, it is also supporting the full actual transport process. Trips can be composed by defining which driver is going with which vehicle to which location when. After which orders can be assigned on these trips. Based on the integrated flexible rate card module, transport invoices can be generated automatically, and put on the customer' account.

A large range of reports is not only supporting the drivers (with loading receipts), and the physical transport process, but can also create any overview needed to manage the daily operation. The TLF TMS is developed to run in multiple depot environments. Within the TMS your transport companies configuration can be completely maintained by the end user, including depot configurations, truck, drivers, packaging type, product types, and so on. The TMS solution is secured with an advanced role based security system where user rights can be assigned to be taken into account properly while using the system.

OPTIONAL MODULES

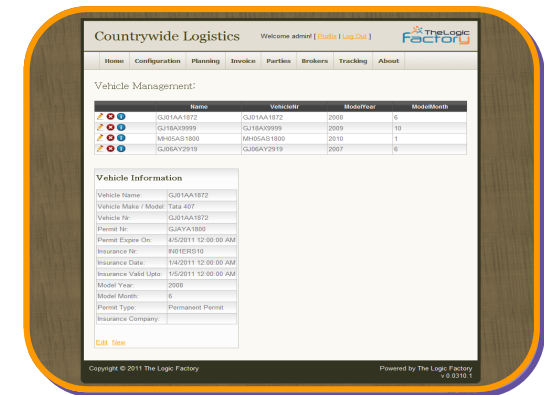

If needed the TMS can be extended with the following modules:

- ◆ Account module, in which open invoices per customer are tracked, and payments are processed.
- ◆ Tracking and tracing, for which a tracking device in the truck is needed, but gives you anytime actual positioning information.
- ◆ SMS, customers can be informed in advance when their delivery is close to their location

SEAMLESS INTEGRATION

The TLF TMS solution is a fully web based solution, so no installation is needed on computers at various locations. Only an internet connection is needed to work with the system, and additionally to that changes made, are immediately visible to other users.

The TLF TMS solution is seamlessly integrating with our Board computers, by integrating these two, drivers can be supplied with actions to be executed, or updated on changes in deliveries. While at the same time, the driver can update about deliveries and exceptions.

DELIVERY MODELS

As the TLF TMS is a web based solution, TLF is having several licensing options:

- ◆ In house, when you are having your own database and webserver, the solution can run at your own servers.
- ◆ Software as a service where the solution can be licensed on a per truck per month basis. In this case the system will run in the TLF owned data center.
